

# SHUHAN TAN

School of Data and Computer Science, Sun Yat-Sen University

Tel: (+86)18275213691, Email: [tanshh@mail2.sysu.edu.cn](mailto:tanshh@mail2.sysu.edu.cn), Website: <https://ariostgx.github.io/website>

## EDUCATION

---

**School of Data and Computer Science, Sun Yat-Sen University** Aug. 2016 - Jun. 2021  
B.E. in Computer Science & Technology  
Overall GPA: 91.7/100, Major GPA: 93.1/100, Overall Ranking: 2/188 (Top 1.06%)

## RESEARCH INTEREST

---

My research interests lie on Machine Learning, Computer Vision and Robotics Learning. I am interested in tackling problems with real-world variance with adaptive vision learning. Currently, my focus is on learning transferable and generalizable models with the help of simulation and transfer learning.

## RESEARCH EXPERIENCE

---

**Simulation for Autonomous Driving** Oct. 2019 - Aug. 2020  
Research Intern **Uber ATG Toronto**

- Advisors: Prof. **Raquel Urtasun**, Prof. **Shenlong Wang**
- **Topic 1: Realistic LiDAR Simulation.**
  - Designed the method to simulate realistic and interesting 3D scenes with rare objects using LiDAR Simulator and CAD models. Created scenes are useful for efficient edge-case testing for 3D perception of autonomous driving.
  - Publication: LidarSIM: Realistic LiDAR Simulation by Leveraging the Real World, **CVPR, 2020**.
- **Topic 2: Realistic Traffic Scene Generation (ongoing).**
  - Aims to automatically generate realistic traffic scenes that can be used for realistic testing or data augmentation in downstream self-driving tasks, *e.g.*, perception and motion prediction.
  - Proposed a data-driven approach to sequentially generate traffic actors to form realistic traffic scenes given map layout. Our method is able to automatically generate traffic scenes across different map areas at large scale.
  - The proposed method is able to create traffic scenes that well match the real traffic scenes. Using our generated traffics scenes for training data augmentation can also improve 3D vehicle detection performance on real road scenes.

## Class-Imbalanced Domain Adaptation

Visiting Researcher

July. 2019 - Sep. 2019

**Boston University**

- Advisor: Prof. **Kate Saenko**, Dr. **Xingchao Peng**
- Aims to remove some impractical assumptions to achieve more practical Domain Adaptation method.
- Proposed the Class-imbalanced Domain Adaptation problem: how to align feature distributions across domains while the label distributions of the two domains are also different.
- Designed a large scale benchmark for this problem with 22 cross-domain tasks. Comprehensive experiments on state-of-the-art methods reveal that most existing methods cannot handle the coexistence of feature and label distribution shifts properly.
- Proposed a simple yet novel combination of current ideas, which outperforms most recent domain adaptation methods on our benchmarks.
- Publication: Class-imbalanced Domain Adaptation: An Empirical Odyssey, **ECCV Workshops**, 2020.

## Domain Adaptation and Person Re-Identification

Undergraduate Researcher

Jan. 2018 - June. 2019

**Sun Yat-Sen University**

- Advisor: Prof. **Wei-Shi Zheng**
- **Topic 1: Weakly Supervised Domain Adaptation.**
- Aims to utilize Domain Adaptation for Person Re-identification problem where we have many partially-labeled data domains (cameras).
- Proposed the weakly-supervised open-set Domain Adaptation setting, where we relax the conventional assumption in Domain Adaptation that there exists a fully-labeled source domain, as well as the assumption that label spaces of the two domains are identical.
- Designed a novel algorithm to transfer knowledge bilaterally between two partly-labeled domains, which was state-of-the-art on both standard datasets and a real-world Person Re-identification.
- Publication: Weakly Supervised Open-set Domain Adaptation by Dual-domain Collaboration, **CVPR**, 2019.
- **Topic 2: Multi-source Domain Adaptation for Unsupervised Person Re-Identification**
- Aims to use Domain Adaptation for Person Re-identification using multiple source data domains.
- Identified the neglect of data distribution differences of images captured by different cameras in the existing methods for Unsupervised Person Re-identification.
- Proposed a domain adaptation method that transfers person identity knowledge from multiple labeled datasets to the target domain in a camera-specific fashion. It outperformed existing methods significantly on standard benchmarks.

## AWARDS

---

Meritorious Award, COMAP Mathematical Contest in Modeling (top %7)	Feb. 2018
Excellent Student Scholarship, SYSU (top %5)	Aug. 2017 - Jul. 2018
Excellent Student Scholarship, SYSU (top %5)	Aug. 2016 - Jul. 2017

## SKILLS

---

<b>Programming</b>	C/C++, Python, Matlab, PyTorch, TensorFlow
<b>Language Proficiency</b>	TOFEL: Total 111 (Reading 30, Listening 30, Speaking 24, Writing 27)
